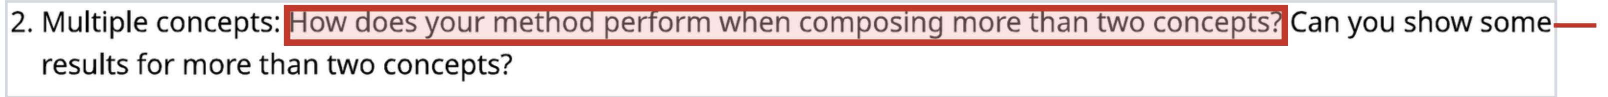
G10: Beyond two animals on SDXL

PrzE question 2, UHz6 weakness 3 (scope) · status: partly answered (SDXL only)

THE REVIEWER'S POINT

PrzE, question 2

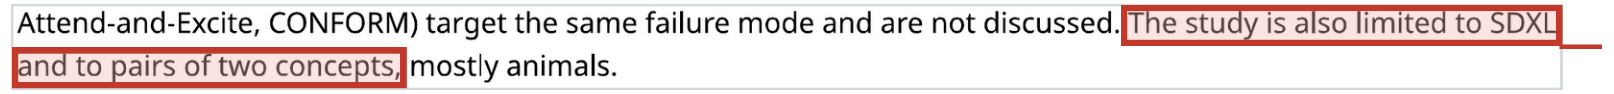


2. Multiple concepts: How does your method perform when composing more than two concepts? Can you show some results for more than two concepts?

P-Q2

Reviews.pdf, page 2 (no text layer; passage located by OCR)

UHz6, weakness 3 (scope)



Attend-and-Excite, CONFORM) target the same failure mode and are not discussed. The study is also limited to SDXL and to pairs of two concepts, mostly animals.

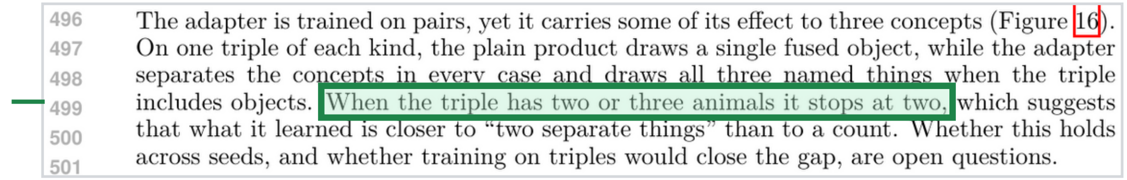
Discussion, three concepts



The adapter is trained on pairs, yet it carries some of its effect to three concepts (Figure 16). On one triple of each kind, the plain product draws a single fused object, while the adapter separates the concepts in every case and draws all three named things when the triple includes objects. When the triple has two or three animals it stops at two, which suggests that what it learned is closer to "two separate things" than to a count. Whether this holds across seeds, and whether training on triples would close the gap, are open questions.

stops at two animals

The reply we plan to send (replies/prze.md: Q2)

partly answered

Q2: multiple concepts

Appendix C.4 (Figure 16) shows one triple of each kind. The plain product fuses the three concepts or drops one; the adapter, trained only on pairs, separates them in every case and draws all three named things when the triple includes objects, but with two or three animals it draws only two. The Discussion now addresses this.

Objects beyond animals are scored in Table 1 (animals with objects, objects); see G4. UHz6's weakness 3 reply is on the G5 page. Every excerpt is a crop of a page render; the file and page are printed under it. Boxes mark text already on the page.
